Build a complete blockchain system in Rust

From Satoshi Nakamoto's whitepaper to a deployed, multi-node network.
Every module, every function, every design decision — explained.

- Blockchain fundamentals: blocks, transactions, Merkle trees, proof-of-work, and the UTXO model
- REST API with Axum and Tower — authentication, middleware, OpenAPI
- Desktop apps in Iced (pure Rust) and Tauri 2 (Rust + React) — same app, two architectures
- Encrypted wallet persistence with SQLCipher
- Deploy with Docker Compose, scale with Kubernetes
- 24 chapters · 12+ Rust technologies · one project
